

## MissKeep App

Build an app for keeping things (reference app "google keep")

### UX (hover states)

Notes Variations:

Build the root component: `<miss-keep>`

Render a list of components, use dynamic components to show different types of notes:

- `note-txt`
- `note-img`

- note-todos
- note-audio: bonus
- note-map: bonus

Support the following features:

- Full CRUD
- Note background color
- Search Notes
- Pin a note to the top of the list
- **Apps Integration:** Allow sending a note content straight into the compose-message page in misterEmail

### Invest in your test data

It is required to create some meaningful data, so when the app starts, it shows relevant demo data.
